Vaccines for Children

Child: My parents, grandparents, and siblings have all been vaccinated. Is it my turn now?

Narrator: Youth ages 5-11 must get vaccinated to protect themselves and their loved ones from the COVID-19. Increasing the total number of people with vaccines also helps protect more vulnerable members of our community, like grandparents.

Caregiver: Do you want to go get vaccinated?

Child: I am ready to protect myself and my family from COVID-19. Besides, I can take it. I got a bunch of vaccines when I was just a baby.

Nurse: The vaccine has been tested rigorously, is safe and is being used around the world. Billions of people including lots of kids aged five or more have already been vaccinated. Getting vaccinated is safe for children, youth, adults, and seniors. The vaccine for children is a smaller dose than the ones given to adults. It is safe for those with allergies and does not interfere with other medication.

Children: Circle, circle, dot, dot now I got my COVID shot!

Child: That didn't even hurt. I'll be sure to come back after two months for my second dose just like you did mom.
