Vaccines for Children - 6 months to 5 years old (1)

Parents with young children are looking at empty pharmacy aisles for Tylenol and Advil.

Parent: Hm... where is the Tylenol? These shelves are empty.

Parent approaches the pharmacist.

Parent: Hi there, do you have fever and pain relief medication for children under 5?

Pharmacist: I'm sorry, we're out of stock right now. Have your children been vaccinated?

Parent: No.. I didn't think I needed to get them vaccinated.

Pharmacist: Vaccines are the best way to protect your kids from getting sick. The COVID-19 vaccine for children aged 6 months to 5 years does an amazing job at keeping them safe from the virus.

Parent: I'm glad that this COVID shot is designed just for kids, I really want to protect them. Where can I get them vaccinated?

Pharmacist: You can go to almost any pharmacy, and there are vaccine clinics too around the city! In fact, I can give them the shot right now.

Parent: That sounds great, let's do it!

Endnote - We do everything we can to protect our children from pain. Emergency rooms are filling up and the shortage of medication continues. There is no shortage of COVID-19 vaccines. Please get your children aged 0-5 vaccinated today.
